CLASS

PATENT NO.	CLASS	PATENT FAMILY CLASSIFICATION CODES
WO 2002065127	ICM	G01N033-543
AB	A system and method for comparing the permittivities of test and ref. samples to detect and identify mol. events is presented. A resonant detector configured to output measurement parameters when the detector is electromagnetically coupled to a supplied sample is provided. One or more ***permittivity*** coeffs. is defined for the detector. A first output parameter is obtained from the detector when the detector is electromagnetically coupled to a ref. sample. A second output parameter is obtained from the detector when the detector is electromagnetically coupled to the test sample. The difference between the first and second output parameters is applied to the one or more ***permittivity*** coeffs. to compute the relative difference in ***permittivity*** between the test sample and ref. sample. The methodol. and app. are primarily of interest to detect and predict mol. events of biol. and pharmaceutical importance that occur in physiol. situations.
